## Technical Tips

### Motorcycle Battery

### Maintenance tips for non mechanics

#### 1. Maintaining your battery

- a) Keep the individual cells in your battery filled to the indicated electrolyte levels with distilled water. This kind of maintenance is done throughout the riding year. The more you ride, the more frequently it should be checked.
- b) If for some reason you know you won't be riding the bike for quite a while, remove your battery from the bike and store it on a wooden, plastic or other non-conductive surface, in a location that does not get below zero degrees Celsius
- c) Finally, connect up your battery to a motorcycle battery charger, to keep it at an optimum level of charge. This is to be done even while the battery is installed on the motorcycle, and when the bike is not used regularly.

#### 2. Benefits of proper battery maintenance

The benefit of good battery maintenance is not only saving money by not replacing your battery before it's 3-5 year life expectancy, but it can keep your battery from failing you on when you are out on a ride....
